

Does anyone know any reason for this? or a way to help me track the problem? Thanks in advance Dani A: It is not related with the registration. Actually it is caused by a virus infection. The PC has been infected and is now not able to run anything. In other words: You need to find out who is your virus' distributor (by your request in your other questions) and remove it. The virus is then able to run. To know more about how to find the virus' distributor see the help desk link in your request.
