Some of the programs that we use in our everyday life nowadays are so heavy that there is no other way to run them but to use the executable files. These are the products of programs that are long and complex in their entirety. From Fortran to Excel or Power Point, it is mandatory to create a shortcut or a.bat file to run these programs to get the results. However, one day, a program arose that turned those files into something light and simple. These are the creation of an application called RunMimic that is a tool that could help you run any application in the form of a.bat file or.exe file. Features: RunMimic is not an application that requires the installation. It is a portable utility that is able to run any executable file just as if it were an installed program. Despite being a portable utility, it still supports the.bat file and.exe file formats. RunMimic allows you to save the location and also the size of any running program and the exact path and the folder that the program is stored. The executable files that you want to run have to be added to RunMimic first. They can be copied and pasted onto RunMimic's text box. Right-click inside the text box to get the context menu with options, such as "Open", "Close", "Copy to Clipboard", "Run", "Close Program", "Save File As", "Send To..." and "Delete". Description: Still a light-weight, portable application, RunMimic allows you to run any program, as if it were an installed application, and to save the location and size of a running program.
