For example, a network of computer systems and user interfaces may control the operations of a large manufacturing plant or a nuclear reactor, or be used to simulate how a complex real-life situation may be handled by the military. In particular, a business or government using such a network of computers may need to maintain a large number of users. As a result, it is often necessary to provide a means by which a large number of users (e.g., thousands of users) can access all (or at least a large portion of) the computers and user interfaces in a network at a particular time. In other words, it is desirable to provide a user with a "single-sign-on" capability—a means by which the user is authenticated to access certain resources (e.g., user interfaces, computer systems) and is redirected to other resources (e.g., other computers and/or user interfaces) that the user may be able to access. Many types of single-sign-on systems for user access to computer systems are known in the art. For example, a centralized computer system may maintain a list of "log-on" information for all users of the central computer system and authenticate each user as the user attempts to log-on to that computer system. The central computer system may obtain authentication information from the user by having the user enter a user name and password. The central computer system may receive the authentication information from the user, use the received information to authenticate the user, and then redirect the user to the appropriate computer and/or user interface. By contrast, a federated computer system is typically a decentralized system that does not maintain a user list. Rather, a user of a federated computer system is authenticated by an intermediate entity (e.g., a central server), and the intermediate entity then transmits authentication information to the user. In other words, a user of a federated computer system is authenticated by an entity (e.g., a central server) that is separate from the user. U.S. Pat. No. 6,122,537 to Bar-Ziv et al., which is hereby incorporated by

TMZ has learned. The picture of Hildebrand is being brought

to you by... Wikipedia -- as part of their list of people who have appeared in the comic books. FYI -- both women look very attractive -- but Hildebrand's apparently not a fan of Greer's nails, so take a close look at her picture. It has a few things wrong with it. The nails are long, the cuticles are raw, and the polish isn't even started. She's showing her real nails -- which doesn't seem to be the way they'd want to be seen. Our sources say Greer's our pic does not meet the standards of the publisher -- and she could be dropped. No word yet on how the pic was taken -- but we're told the publisher made the decision to use the pic after Greer failed a few standards.The present invention relates to an intake air quantity control system for an internal combustion engine, and more particularly, to a throttle body intake air quantity control system of the type equipped with a sensor which detects the rotation of the engine crankshaft for producing a signal proportional to the engine rotational 3da54e8ca3
